- Multi-Factor authentication support
- Fully managed by us (server upgrades, maintenance, etc.)
- Advanced file recovery options
- Document sharing & public link generation
- Cross-platform synchronization
- Active Directory Integration
- File synchronization and sharing

HOSTED FILE SERVER

- Fully Managed Cloud solution for your files and business. Rose Drive provides cloud synchronization for files using secure encryption and ransomware protection.
- User file control is essential for maintaining data security. Stop users from using multiple cloud solutions for storing data by bringing all your data under one program.
- Most employees use many cloud apps for storing files like OneDrive, Dropbox, Box.net, etc. your company files are likely being stored on several different platforms.
- Using Rose Drive will make it easier to keep track of files maintaining data security and integrity.
- Eliminate the need for on-premise file servers and multiple sync clients. Files synchronized with our servers are backed up and available even if your on-premise server is not.

SECURITY

Ransomware Protection

Rose Drive uses built-in ransomware protection which detects file-level changes and locks the user's device out of servers before any more data is compromised. Our servers are protected with up-to-date Anti-Virus/Malware protection.

Daily Backups

Your data is safe and secure. We maintain daily backups with a retention period of 90 days. We also store encrypted backup data on offsite servers.

Access Policy Management

Control team folder access and maintain individual user data privacy through folder permissions. There are granular sharing options available for individuals outside your organization.

Firewall Security

Our servers are protected with up-to-date Anti-Virus/Malware protection and placed behind a secure firewall for ultimate control and management.

USER & DEVICE CONTROL

RoseDrive FOR BUSINESS

Optionally, you can combine Rose Drive and Jump Cloud to maximize your user control and keep track of devices.

Many businesses have started using cloud-hosted platforms to replace legacy self-hosted databases and some have gone completely serverless. This works for some organizations, but they end up losing device and user control. The ability to disable login, change passwords, and remote lockout are rarely considered.

To truly function in a “cloud-only” environment, a business must consider several factors outside of data storage, and getting rid of Microsoft Active Directory server is not recommended unless you have a suitable secure alternative.

What do we recommend?

- Jump Cloud: Active Directory replacement
- Rose Drive: On-Premises file server replacement
